TEST REPORT DECLARATION

Applicant : Shenzhen Yongjiu Precision Electronics Co.,Ltd.

Manufacturer : Shenzhen Yongjiu Precision Electronics Co.,Ltd.

EUT Description: Wall Charger

(A) Model No. : YJ-N24, OPP143, OPP153, OPP063

(B) Trademark : N/A

C) Ratings Supply : Input: 100-240Va.c. 50/60Hz 1.1A

Output: 5Vd.c. 4.8A total

(2.4A+2.4A) 24W

(D) Test Voltage : AC230V, 50Hz

Measurement Standard Used: EN 55032:2015+A11:2020, EN 55035:2017+A11:2020,

EN IEC 61000-3-2:2019+A1:2021,

EN 61000-3-3:2013+A2:2021

The device described above is tested by Guangdong Lintek Certification Group Co., Ltd. to determine the maximum emission levels emanating from the device and the severe levels of the device can endure and its performance criterion. The test results are contained in this test report and Guangdong Lintek Certification Group Co., Ltd. is assumed full responsibility for the accuracy and completeness of test. Also, this report shows that the EUT is technically compliant with the EN 55032, EN IEC61000-3-2, EN 61000-3-3 and EN 55035 requirements.

This report applies to above tested sample only. This report shall not be reproduced in part without written approval of Guangdong Lintek Certification Group Co., Ltd.

1. SUMMARY OF STANDARDS AND RESULTS

1.1. Description of Standards and Results

The EUT have been tested according to the applicable standards as referenced below.

EMISSION					
Description of Test Item	Standard	Lim	Results		
Conducted disturbance at mains terminals test	EN 55032	Section Tab		PASS	
Radiated disturbance	EN 55032	Section Tab		PASS	
Harmonic current emissions	EN IEC 61000-3-2	Clas	s A	PASS	
Voltage fluctuations & flicker	EN 61000-3-3	Secti	on 5	PASS	
IMMUNITY					
Description of Test Item	Basic Standard	Performance Criteria	Observation Criteria	Results	
Electrostatic discharge (ESD)	IEC 61000-4-2	В	А	PASS	
Radio-frequency, Continuous radiated disturbance	IEC 61000-4-3	А	Α	PASS	
Electrical fast transient (EFT)	IEC 61000-4-4	В	Α	PASS	
Surge (Input a.c. power ports)	IEC 61000-4-54	В	Α	PASS	
Radio-frequency, Continuous conducted disturbance	IEC 61000-4-6	А	А	PASS	
Voltage dips, Interruptions	IEC 61000-4-11	B&C	A&B&C	PASS	
N/A is an abbreviation for Not Applicable.

2. GENERAL INFORMATION

2.1. Description of Device (EUT)

Description: Wall Charger

Classification: Class II

Model Number: YJ-N24, OPP143, OPP153, OPP063

DIFF. : All models are the same except model name, color and

output. The model YJ-N24 was selected to be tested.

Trademark : N/A

Applicant : Shenzhen Yongjiu Precision Electronics Co.,Ltd.

Address : 7/F, Sunjet Industrial Park, No.5 - 1, Dawangshan Industrial

Rd 2nd, Shajing, Bao'an, Shenzhen, 518104, China

Manufacturer : Shenzhen Yongjiu Precision Electronics Co.,Ltd.

Address : 7/F, Sunjet Industrial Park, No.5 - 1, Dawangshan Industrial

Rd 2nd, Shajing, Bao'an, Shenzhen, 518104, China

Sample Type: Prototype production

2.2. Block Diagram of connection between EUT and simulators

EUT: Wall Charger

2.3.Test Facility

2.3.1. Laboratory Name:

Guangdong Lintek Certification Group Co., Ltd.

2.3.2. Site Location:

302, Building B, Xunli Science and Technology Park, No.36 Zhangge Road, Fucheng Street, Longhua District, Shenzhen, Guangdong Province, China

2.4. Measurement Uncertainty

(95% confidence levels, k=2)

1 , ,		
Test Item	Uncertainty	U _{cispr}
Uncertainty for Conduction emission test	2.50dB	3.8 dB
Uncertainty for Radiation Emission test	3.04 dB (Distance: 3m Polarize: V) 3.02 dB (Distance: 3m Polarize: H)	5.2 dB
Uncertainty for Power Clamp Test	3.94 dB	4.5 dB
Uncertainty for Flicker test	0.05%	N/A
Uncertainty for Harmonic test	1.8%	N/A

3.2. Block Diagram of Test Setup

3.3. Conducted Disturbance at Mains Terminals Test Standard and Limit

3.3.1.Test Standard EN55032, Class B

3.3.2.Test Limit

Frequency	At mains terminals (dBμV)		
ricquerioy	Quasi-peak Level	Average Level	
150kHz ~ 500kHz	66 ~ 56 *	56 ~ 46 *	
500kHz ~ 5MHz	56	46	
5MHz ~ 30MHz	60	50	

Notes: 1. Emission level=Read level+LISN factor-Preamp factor+Cable loss

- 2* Decreasing linearly with logarithm of frequency.
- 3. The lower limit shall apply at the transition frequencies.

3.4. EUT Configuration on Test

The following equipments are installed on conducted disturbance at mains terminals to meet EN55032 requirement and operating in a manner which tends to maximize its emission characteristics in a normal application.

Report No.: LTR23022153E02

3.5. Operating Condition of EUT

- 3.5.1. Setup the EUT as shown in section 3.2.
- 3.5.2. Turned on the power of all equipments.
- 3.5.3.Let the EUT worked in test mode 15 minutes after taking the test.

3.6. Test Procedure

The EUT was placed on a non-metallic table, 80cm above the ground plane. The EUT Power connected to the power mains through a line impedance stabilization network (L.I.S.N. #1). The power line was checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipments and all of the interface cables were changed according to EN55032 on Conducted Disturbance at Mains Terminals test.

The bandwidth of test receiver (R & S ESCI) is set at 10kHz.

The frequency range from 150kHz to 30MHz is checked. The test result are reported on Section 3.7.

3.7. Conducted Disturbance at Mains Terminals Test Results.

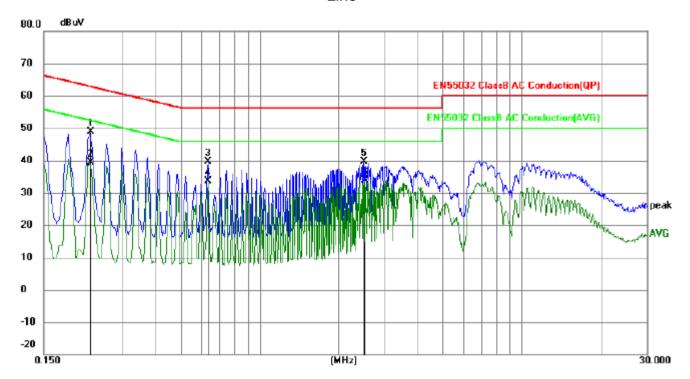

PASS

The test data see below.

4.2. Block Diagram of Test Setup

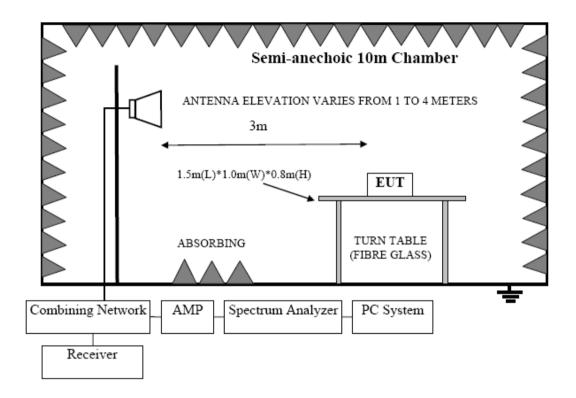

4.2.1. In Semi Anechoic Chamber (3m) Test Setup Diagram for 30MHz~1000MHz

Page 16 of 45 Report No.: LTR23022153E02

4.2.2. In Semi Anechoic Chamber (3m) Test Setup Diagram for 1000MHz~6000MHz

4.3. Test Standard

EN55032, Class B

4.4. Radiated Disturbance Limit

All emanations from a devices or system, including any network of conductors and apparatus connected thereto, shall not exceed the level of field strengths specified below:

Source	DISTANCE	FREQUENCY	Limits(dBμV/m)
	(Meters)	(MHz)	Quasi-Peak
Local Oscillator	3	≦1000	Fundamental 60
	3	30~300	Harmonics 52
	3	300~1000	Harmonics 56
Other	3	30~230	40
	3	230~1000	47

Note: (1) Emission level = Read level+Antenna Factor-Preamp Factor +Cable Loss (2) The lower limit shall apply at the transition frequencies.

Page 17 of 45 Report No.: LTR23022153E02

(3) Distance refers to the distance in meters between the test instrument antenna and the closed point of any part of the E.U.T.

4.5. EUT Configuration on Test

The EN55032 regulations test method must be used to find the maximum emission during Radiated Disturbance test. The configuration of EUT is same as used in Conducted Disturbance test. Please refer to Section 3.5.

4.6. Operating Condition of EUT

- 4.6.1. Setup the EUT and simulator as shown as Section 5.2.
- 4.6.2. Turned on the power of all equipment.
- 4.6.3. Let the EUT work in test mode 15 minutes after taking the test.

4.7. Test Procedure

The EUT was placed on a non-metallic table, 80 cm above the ground plane inside a semi-anechoic chamber. An antenna was located 3m & 3m from the EUT on an adjustable mast. A pre-scan was first performed in order to find prominent radiated emissions. For final emissions measurements at each frequency of interest, the EUT were rotated and the antenna height was varied between 1m and 4m in order to maximize the emission. Measurements in both horizontal and vertical polarities were made and the data was recorded. In order to find the maximum emission, the relative positions of equipments and all the interface cables were changed according to EN 55032 on Radiated Disturbance test.

The bandwidth setting on the test receiver (Rohde&Schwarz Test Receiver ESCI) is 120 kHz.

4.8. Test result

PASS. (All emissions not reported below are too low against the prescribed limits. Only report the worst result for all 4 models)

The EUT with the following test mode was tested and read QP values, the test results are listed in next pages.

Temperature: 24.2°C Humidity: 54%

The details of test mode is as follows:

No.	Test Mode

Page 18 of 45 Report No.: LTR23022153E02

1	output loaded 5V/4.8A(2.4A+2.4A)

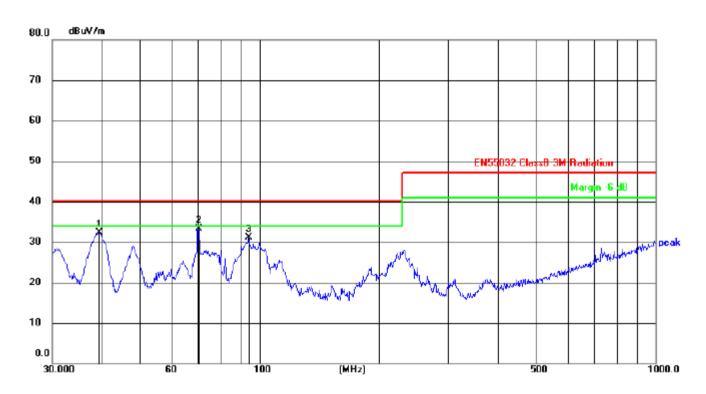

For frequency range 1GHz~6GHz

The highest frequency of the internal sources of the EUT is less than 108 MHz, the measurement shall only be made up to 1 GHz. So the frequency rang 1GHz-6GHz radiation test not applicable.

8≤n≤40	$0.23 \frac{8}{n}$

5.5. Operating Condition of EUT

Same as section 3.6. except the test set up replaced by section 7.2..

5.6. Test Procedure

The EUT was placed on the top of a wooden table 0.8 meters above the ground and operated to produce the maximum harmonic components under normal operating conditions for each successive harmonic component in turn. The correspondent test program of test instrument to measure the current harmonics emanated from EUT is chosen. The measure time shall be not less than the necessary for the EUT to be exercised.

5.7. Test Results

PASS

6. VOLTAGE FLUCTUATIONS & FLICKER TEST

6.1. Test Equipments

Same as Section 7.1.

6.2. Block Diagram of Test Setup

Same as Section 7.2.

6.3. Voltage Fluctuation and Flicker Test Standard

EN 61000-3-3

6.4. Limits of Voltage Fluctuation and Flick

Test Item	Limit	Note				
P _{st}	1.0	P _{st} means Short-term flicker indicator				
Plt	0.65	Plt means long-term flicker indicator				
T _{dt}	0.2	T _{dt} means maximum time that dt exceeds 3%				
d _{max} (%)	4%	d _{max} means maximum relative voltage change.				
d _c (%)	3%	d _c means relative steady-state voltage change.				

6.5. Operating Condition of EUT

Same as Section 7.5.

6.6. Test Procedure

The EUT was placed on the top of a wooden table 0.8 meters above the ground and operated to produce the most unfavorable sequence of voltage changes under normal conditions During the flick measurement, the measure time shall include that part of whole operation changes. The observation period for short-term flicker indicator is 10 minutes and the observation period for long-term flicker indicator is 2 hours.

6.7. Test Results

PASS

7. IMMUNITY PERFORMANCE CRITERIA DESCRIPTION

Performance Level

The test results shall be classified in terms of the loss of function or degradation of performance of the equipment under test, relative to a performance level by its manufacturer or the requestor of the test, or the agreed between the manufacturer and the purchaser of the product.

Definition related to the performance level:

- 1. Based on the used product standard
- 2. Based on the declaration of the manufacturer, requestor or purchaser Criterion A:

Definition: normal performance within limits specified by the manufacturer, requestor and purchaser.

The *apparatus* shall continue to operate as intended during the test and after the test. No degradation of performance or loss of function is allowed below a performance level (or permissible loss of performance) specified by the manufacturer, when the apparatus is used as intended. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and from what the user may reasonably expect from the apparatus if used as intended.

Criterion B:

Definition: temporary loss of function or degradation of performance which ceases after the disturbance ceases, and from which the equipment under test recovers its normal performance, without operator intervention.

The apparatus shall continue to operate as intended after the test. No degradation of performance or loss of function is allowed below a performance level (or permissible loss of performance) specified by the manufacturer, when the apparatus is used as intended. The performance level may be replaced by a permissible loss of performance. During the test, degradation of performance is allowed, however. No change of actual operation state or stored data is allowed. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and from what the user may reasonably expect form the apparatus the apparatus if used as intended. Criterion C:

Definition: temporary loss of function or degradation of performance, the correction of which requires operator intervention.

Temporary loss of function is allowed, provided the function is self-recoverable or can be restored by the operation of the controls, or by any operation specified in the instructions for use.

Criterion D:

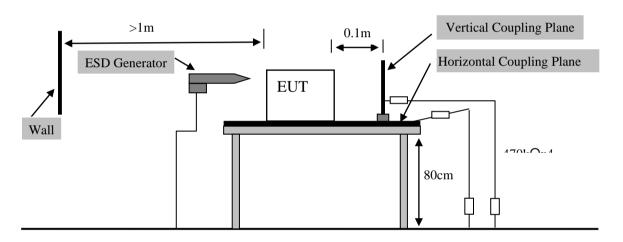

Definition: loss of function or degradation of performance, which is not recoverable, owing to damage to hardware or software, or loss of data.

8. ELECTROSTATIC DISCHARGE TEST

Page 26 of 45 Report No.: LTR23022153E02

A Special		Х	Special	Special
-----------	--	---	---------	---------

8.4.2.Performance criterion: **B**

8.5. EUT Configuration

The configuration of EUT are listed in section 3.5.

8.6. Operating Condition of EUT

Same as conducted test which is listed in section 3.6. except the test setup replaced by section 10.2.

8.7. Test Procedure

8.7.1.Air Discharge:

The test was applied on non-conductive surfaces of EUT. The round discharge tip of the discharge electrode was approached as fast as possible to touch the EUT. After each discharge, the discharge electrode was removed from the EUT. The generator was re-triggered for a new single discharge and repeated 20 times for each pre-selected test point. This procedure was repeated until all the air discharge completed

8.7.2.Contact Discharge:

All the procedure was same as Section 10.7.1. except that the generator was re-triggered for a new single discharge for each pre-selected test point. The tip of the discharge electrode was touch the EUT before the discharge switch was operated.

8.7.3. Indirect discharge for horizontal coupling plane

At least 20 single discharges were applied to the horizontal coupling plane, at points on each side of the EUT. The discharge electrode positions vertically at a distance of 0.1m from the EUT and with the discharge electrode touching the coupling plane.

8.7.4. Indirect discharge for vertical coupling plane

At least 20 single discharge were applied to the center of one vertical edge of the coupling plane. The coupling plane, of dimensions 0.5m X 0.5m, was placed parallel to, and positioned at a distance of 0.1m from the EUT. Discharges were applied to the coupling plane, with this plane in sufficient different positions that the four faces of the EUT are completely illuminated.

8.8. Test Results

PASS.

The EUT was tested and all the test results are listed in next page.

9.4.2. Performance criterion: A

9.5. EUT Configuration

The configurations of EUT are listed in Section 3.5.

9.6. Operating Condition of EUT

Same as Conducted Emission test that is listed in Section 3.6. except the test set up replaced by Section 11.2.

9.7. Test Procedure

Testing was performed in a Fully anechoic chamber as recommended by IEC 61000-4-3. The EUT was placed on an 80 cm high non-conductive table located in the area of field uniformity. The radiating antenna was placed 3m in front of the EUT and Support system, and dwell time of the radiated interference was controlled by an auSunny Yuanated, computer-controlled system. The signal source was stepped through the applicable frequency range at a rate no faster than 1% of the fundamental.

The signal was amplitude modulated 80% over the frequency range 80 MHz to 1GHz at a level of 3 V/m. The dwell time was set at 3 s. Field presence was monitored during testing via a field probe placed in close proximity to the EUT. Throughout testing, the EUT was closely monitored for signs of susceptibility. The test was performed with the antennae oriented in both a horizontal and vertical polarization.

All the scanning conditions are as follows:

Condition of Test	Remarks
 Test Fielded Strength 	3 V/m (Severity Level 2)
Radiated Signal	80% amplitude modulated with
	a 1kHz sine wave
3. Scanning Frequency	80 - 1000 MHz
Sweeping time of radiated	0.0015 decade/s
5. Dwell Time	1 Sec.

9.8. Test Results

PASS.

The EUT was tested and all the test results are listed in next page.

10.5.EUT Configuration

The configuration of EUT are listed in section 3.5.

age 32 of 45 Report No.: LTR23022153E02

10.6. Operating Condition of EUT

Same as conducted test which is listed in section 3.6. except the test setup replaced by section 12.2.

10.7.Test Procedure

The EUT and its simulators were placed on the ground reference plane and were insulated from it by an wood support $0.1m \pm 0.01m$ thick. The ground reference plane was 1m*1m metallic sheet with 0.65mm minimum thickness. This reference ground plane was project beyond the EUT by at least 0.1m on all sides and the minimum distance between EUT and all other conductive structure, except the ground plane was more than 0.5m. All cables to the EUT was placed on the wood support, cables not subject to EFT/B was routed as far as possible from the cable under test to minimize the coupling between the cables.

10.7.1. For input and output AC power ports:

The EUT was connected to the power mains by using a coupling device which couples the EFT interference signal to AC power lines. Both positive transients and negative transients of test voltage were applied during compliance test and the duration of the test can't less than 1min.

10.7.2. For signal lines and control lines ports:

It's not I/O ports.

It's unnecessary to measure.

10.7.3. For DC input and DC output power ports:

It's not DC ports.

It's unnecessary to measure.

10.8.Test Result

PASS.

The EUT was tested and all the test results are listed in next page.

The configuration of EUT are listed in section 3.5.

11.6. Operating Condition of EUT

Same as conducted test which is listed in section 3.6. except the test setup replaced by section 13.2.

11.7.Test Procedure

- 1) Set up the EUT and test generator as shown on Section 13.2.
- 2) For line to line coupling mode, provide a 1kV 1.2/50us voltage surge (at open-circuit condition) and 8/20us current surge to EUT selected points, and for active line / neutral line to ground are same except test level is 2kV.
- 3) At least 5 positive and 5 negative (polarity) tests with a maximum 1/min repetition rate are applied during test.
- 4) Different phase angles are done individually.
- 5) Record the EUT operating situation during compliance test and decide the EUT immunity criterion for above each test.

11.8.Test Result

PASS.

The EUT was tested and all the test results are listed in next page.

12.5.EUT Configuration

The configuration of EUT are listed in section 3.5.

12.6. Operating Condition of EUT

Same as conducted test which is listed in section 3.6. except the test set up replaced by section 14.2.

12.7.Test Procedure

- 1) Set up the EUT, CDN and test generators as shown on section 14.2.
- 2) Let EUT work in test mode and measure.
- 3) The EUT and supporting equipments are placed on an insulating support 0.1m high above a ground reference plane. CDN (coupling and decoupling device) is placed on the ground plane at above 0.1-0.3m from EUT. Cables between CDN and EUT are as short as possible, and their height above the ground reference plane shall be between 30 and 50 mm (where possible).
- 4) The disturbance signal described below is injected to EUT through CDN.
- 5) The EUT operates within its operational mode(s) under intended climatic conditions after power on.
- 6) The frequency range is swept from 150kHz to 230MHz using 3V signal level, and with the disturbance signal 80% amplitude modulated with a 1kHz sine wave.
- 7) The rate of sweep shall not exceed 1.5*10-3decades/s. Where the frequency is swept incrementally, the step size shall not exceed 1% of the start and thereafter 1% of the preceding frequency value.
- 8) Recording the EUT operating situation during compliance testing and decide the EUT immunity criterion.

12.8.Test Results

PASS.

The EUT was tested and all the test results are listed in next page.
