

Product Carbon Footprint PowerStore 500T Typical Report Produced May 2023

At Dell Technologies we are working to reduce the environmental impact of our products. We look at every part of the product's lifecycle, from materials, manufacturing, and shipping to use and end-of-life management after it leaves our doors.

To calculate this Dell Technologies uses PAIA (Product Attribute to Impact Algorithm) to perform product carbon footprints. PAIA is a streamlined Life-Cycle Assessment (LCA) tool developed by [MIT's Materials System Laboratory](#). It takes into consideration important attributes of the product which can be correlated to activities in order to calculate the product carbon footprint.

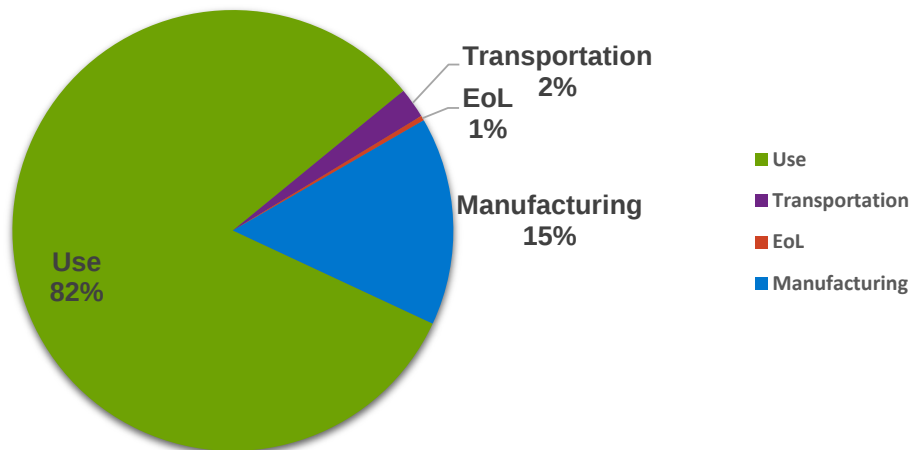

Carbon footprint calculations have a wide range based on a variety of factors including how the device is configured, where it was manufactured and more. Dell Technologies reports the 5th and 95th percentile of the carbon footprint estimate to reflect that uncertainty. For this product, that estimate has a mean of 10824 kg of CO₂e and standard deviation of 5511 kg of CO₂e.

Assumptions for calculating product carbon footprint:

Product Weight	40.1 kg	Server Type	Rack	Assembly Location	Asia
Product Lifetime	4 years	Use Location	Europe	Energy Demand (Yearly TEC) ¹	4467 kWh
HDD/SSD Quantity	11	DRAM Capacity	96GB	CPU Quantity	2
Fan Count	12	PSU Count	2	Core Count per CPU	0

ESTIMATED IMPACT BY LIFECYCLE STAGE

Disclaimer: This PCF was calculated using the PAIA model, version 1.3.2.2023, copyright by the ICT Benchmarking collaboration, which includes the Massachusetts Institute of Technology's Materials Systems Laboratory and partners. Results shown here are subject to change as the tool is updated. The Use component of the PCF assumes a PUE of 1.0. If your Data Center PUE differs from 1.0, the Use component may be ratiometrically scaled up from a PUE of 1.0.

1 Typical ENERGY STAR power computation used to derive this value. *TEC is the Total Energy Consumption*
