- AMD Ryzen™ Threadripper™ PRO 7000WX and 9000WX Series processors support ECC memory

The CPUs determine the speed at which the memory is clocked. If a 6400 MHz capable CPU is used in the system, the maximum speed the memory will run at is 6400 MHz regardless of the specified speed of the Memory. If the memory speed is rated lower than the CPU capability (ie - 5600 MHz) the whole system will run at this slower speed.

<sup>1</sup> Multicore is designed to improve performance of certain software products. Not all customers or software applications will necessarily benefit from use of this technology. Performance and clock frequency will vary depending on application workload and your hardware and software configurations. AMD's numbering is not a measurement of clock speed.

#### Notes for all graphics cards:

- Some graphics and GPU compute cards can consume a great deal of power, thus combinations of cards with other components may exceed a particular power supply's output capability.
- Some graphics and GPU compute cards require supplemental power cables. Not all chassis/PSU configurations have enough supplemental power cables of the correct type for all graphics configurations. Refer to table below for guidance on required power cables based on configured power supply and graphics.

PSU	PSU Aux Power (Graphics)	Graphics Power Adapter/Dongle (spare part number shown below)	Graphics Power Connector (per card)	Max Graphics Card Config
