Getting Started

Verify your shipment

Before racking the system, verify the shipment using Secured Component Verification (SCV). It is a supply chain assurance offering that enables customers to verify the PowerEdge server received matches with the manufactured configuration. SCV requires a license to be purchased (point of sale only). In order to validate components, a certificate containing the unique system component IDs is generated during the factory assembly process. This certificate is signed in the Dell factory and is stored in the system, later used by the SCV application. The SCV application validates the system inventory against the SCV certificate. To validate, download the SCV application from the [Dell Support](#) page. Enter the Service Tag, go to the **Drivers and Downloads** section, and search for the keyword 'SCV' to find the download link. For more information, see [Secured Component Verification](#).

Rack the system

Your system may support static, sliding, or combo rails for racks along with Cable Management Arm (CMA) or Strain Relief Bar (SRB). See the [Rail Sizing and Rack Compatibility Matrix](#) for your system supported rail information.

Configuration, Data Security, and Service Management

Configure and Manage

Dell provides out-of-band management capabilities through a system-integrated Dell Remote Access Controller (iDRAC), to manage your systems along with partner console Integrations and Connections for third-party consoles. See the [System Management Overview Guide](#) to learn more about the systems management portfolio.

Secure your data

Dell PowerEdge servers have featured robust security for several generations, including the innovation of using silicon-based data security. iDRAC provides security features that can be configured to the recommended settings to maximize the security posture of the system. See the [Security Configuration](#) for guidance provided based on a diverse set of installed systems.

NOTE: The guidance may not represent the actual risk or guidance to your local installation and individual environment. It is recommended that all users determine the applicability of this information to their individual environments and take appropriate actions.

Receiving automated support with Secure Connect Gateway (SCG)

Dell Secure Connect Gateway (SCG) is an optional Dell Services offering that automates technical support for your Dell server, storage, and networking devices. By installing and setting up a Secure Connect Gateway (SCG) application in your IT environment, you can receive the following benefits:

- Automated issue detection — Secure Connect Gateway (SCG) monitors your Dell devices and automatically detects hardware issues, both proactively and predictively.
- Automated case creation — When an issue is detected, Secure Connect Gateway (SCG) automatically opens a support case with Dell Technical Support.
- Automated diagnostic collection — Secure Connect Gateway (SCG) automatically collects system state information from your devices and uploads it securely to Dell. This information is used by Dell Technical Support to troubleshoot the issue.
- Proactive contact — A Dell Technical Support agent contacts you about the support case and helps you resolve the issue.

The available benefits vary depending on the Dell Service entitlement purchased for your device. For more information about Secure Connect Gateway (SCG), go to [secureconnectgateway](#).
