

AirObic Mouse

Onyx

Pearl

Vertical is good, Gripless is better! Untwisting your wrist takes the tension off of those muscles, but can, in some designs, be at the expense of employing "Pinch Grip" with fingers extended forwards, which ergonomic experts say is the worst type of grip.

The AirObic has you place your hand in it, not on or around, it so you do not have to use the smaller muscle that can become injured. Fatigue affects all muscles when they are under anything but a resting tension. A Gripless, so "Functional Neutral" posture, one part of the Aerobic Mouse Anti.Fatigue strategy, provides for lowest physiological load so helps to avoid the hours of muscle tension that can cut off the oxygen supply in muscles while they are tensed.

It makes it more comfort to work and limbs that are comfortable tend not to ache and if people don't ache they are less likely to injure!

It helps those with disability or who have developed impairments to work as effectively and productively as everyone else and reduce the likelihood of further impairment due to their circumstance.

"A clinical study has shown that changing your mouse to AirObic mouse increased (improved) nerve conduction response in users arms. An increase in Median Nerve Conduction Velocity beyond a certain point is a diagnostic for Carpal Tunnel Syndrome (CTS). An increase was not only seen in persons with diagnosable CTS but also in persons whose values were in the normal range; their nerve conduction velocities increased moving them further into the normal range and away from the diagnostic threshold level."

Technical Specification

- USB
- Plug 'n' Play (does not require a driver or software to be loaded onto your computer).
- Optical Tracking System for low maintenance high accuracy
- 3 Mouse Button Design
- Scroll Wheel for ease of internet operation
- Lightweight easy clean body
- Detailed manual and posture recommendations
